
Compare the complete project decision.

Gather the inputs before comparing a local workstation with a remote plan.

Define equivalent work

01 People and project term

Record total users, simultaneous users, project duration and expected usage hours. Do not compare part-time access with unrestricted full-time capacity.

02 Local equipment

Use an actual quote or known purchase cost. Include setup, warranty, support and any equipment that can be reused or redeployed.

03 Endpoint and connectivity

A remote workstation still needs an access device and a suitable connection. Include any incremental equipment or connectivity cost.

04 Remote proposal

Record the actual quoted configuration, usage, access rules, onboarding, storage, support, additional-use policy and project term.

Project notes

Complete the worksheet

Keep the review specific to the accepted project scope.

05 Project term / users / simultaneous users

06 Local purchase or reuse / setup / support / retained value

07 Remote quote / setup / endpoint / storage / support

08 What changes if the project is extended or cancelled?

A fair decision

Compare equivalent scope and the complete project term. Keep unquoted values blank. The right choice may be reuse, purchase, existing remote access or a scoped workstation service.
